

Physiological imaging of sport related head injury

D.J. Cook MD, PhD, FRCS(C), FAANS
Translational Stroke Research Program
Queen's University
Centre for Neuroscience Studies
June 6, 2018

Concussion as a Metabolic Syndrome

Following Initial Injury:

- Vulnerability to Subsequent Injury
- Exacerbation of Symptoms: Activity, Cognition, Screen time, Lack of Sleep
- Rest as an element of recovery

***THEREFORE IMAGING
METABOLISM AS BIOMARKER
OF CONCUSSION**

Imaging Cerebrovascular Autoregulation

Imaging Acute Injury

- 32yo hockey player
- Left side check with right temple area striking glass
- Headache 2 days post injury
- Persistent headache and fatigue 7 days post injury
- Scan obtained 8 days post injury
- Symptom inventory 32/122
- Normal neurological examination

Physiological Imaging and Concussion

- Baseline scanning
- Acute symptomatic injury
- Imaging During Training
- Measuring Recovery

Future Directions

- Ongoing Clinical studies in Athletes and Military Personnel
- Combined modality MRI imaging to separate acute from chronic injury
 - Machine Learning applications to process, sort and separate data
 - Predictive analytics for recovery based on brain imaging
- Application of Near Infrared Spectroscopy for Acute, non-invasive, bedside/portable brain imaging
